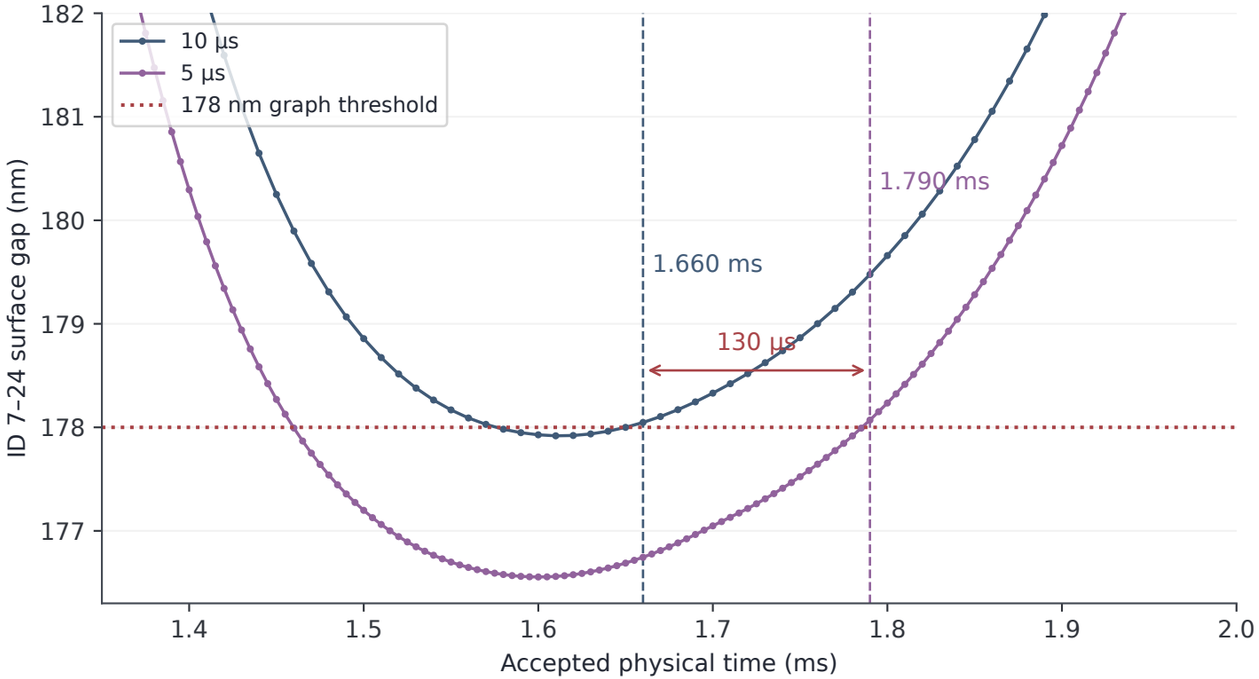
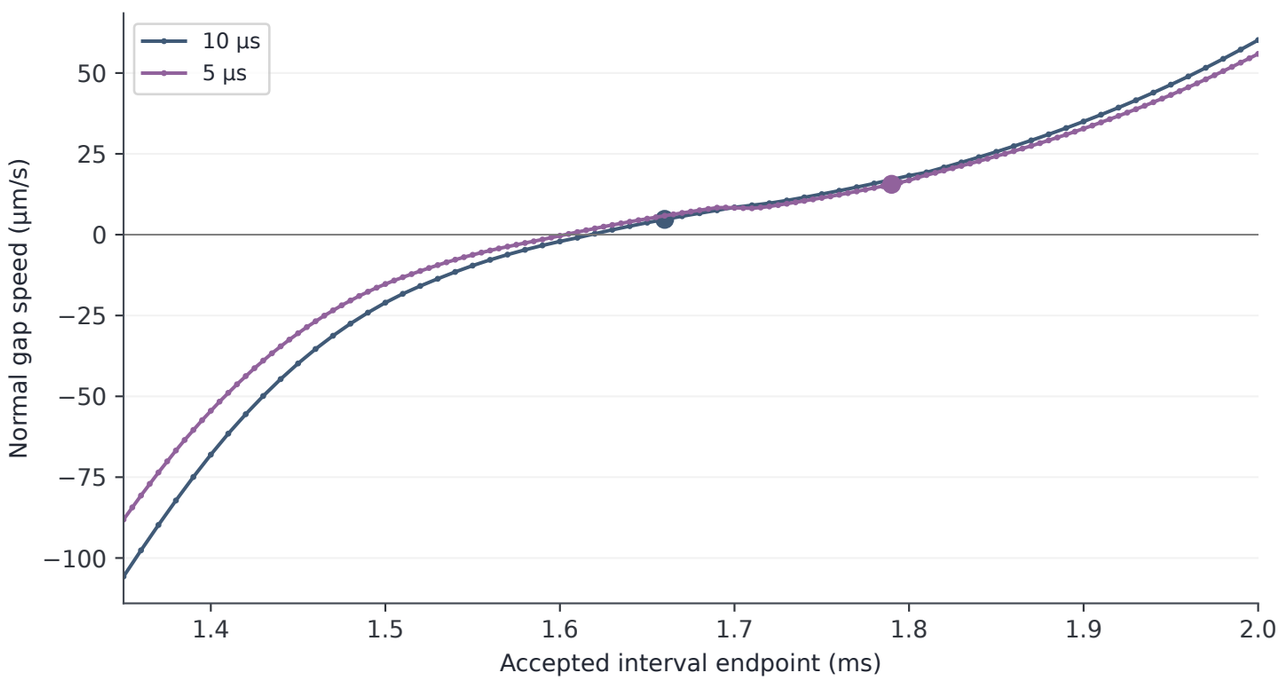
B2 edge timing: accepted-state threshold crossings

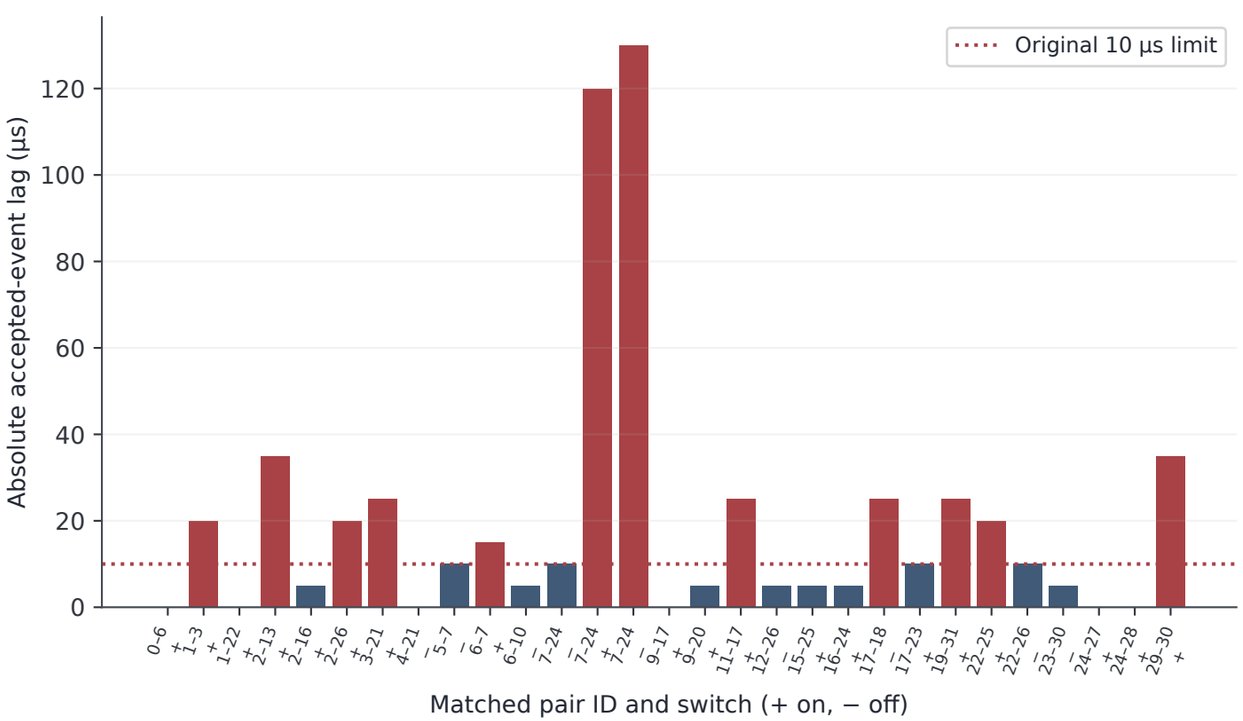
a Small gap differences near a turning point



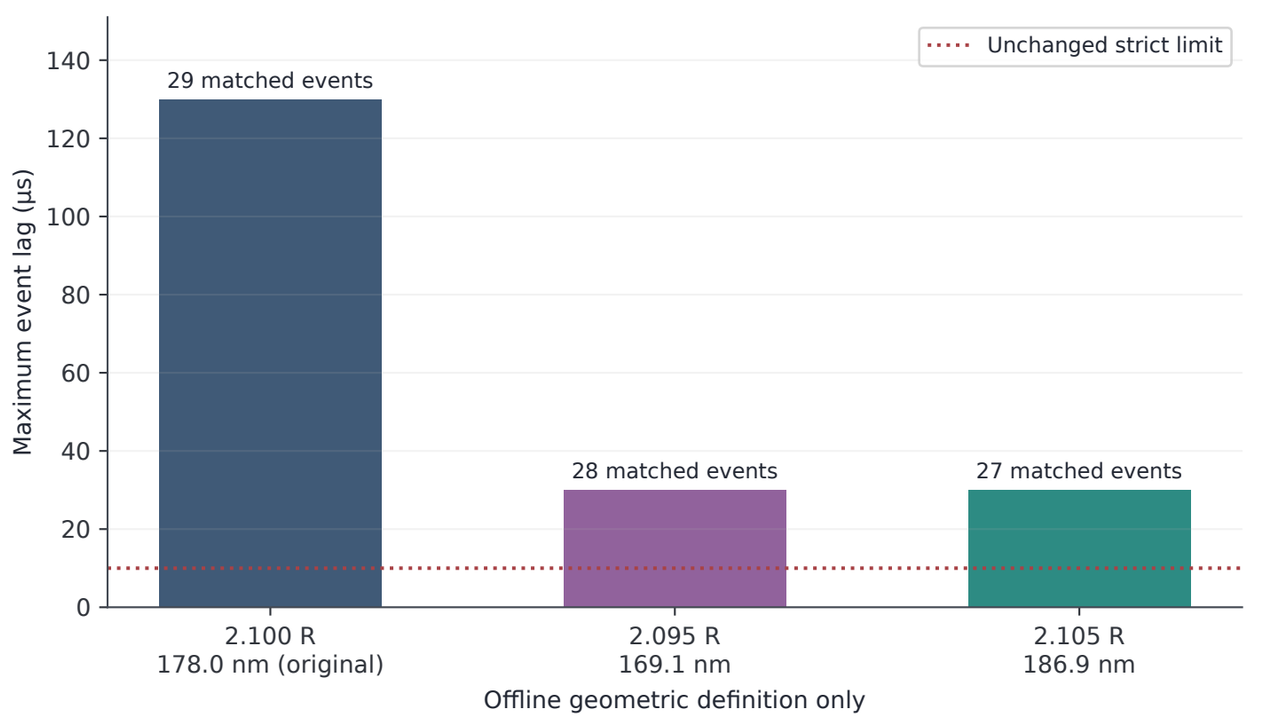
b Final disconnect: +4.73 / +15.58 µm/s



c All 29 events matched; 12 timing failures



d Threshold sensitivity; no changed trajectory



O / seed 1102, R = 1.78 µm. Markers are actual accepted steps; connecting lines guide the eye, not new physical frames.
Graph connectivity at a 178 nm surface gap is not sphere contact. No interpolated crossing replaces the original strict event gate.
