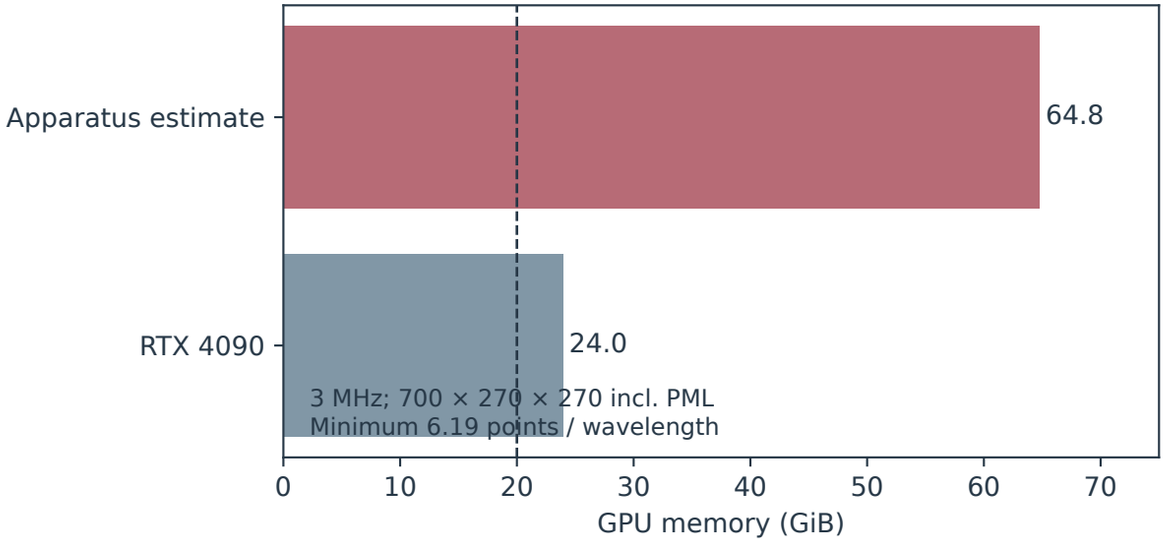
F10M | Acoustic admission and measured numerical checks

a Full apparatus field: NOT_RUN



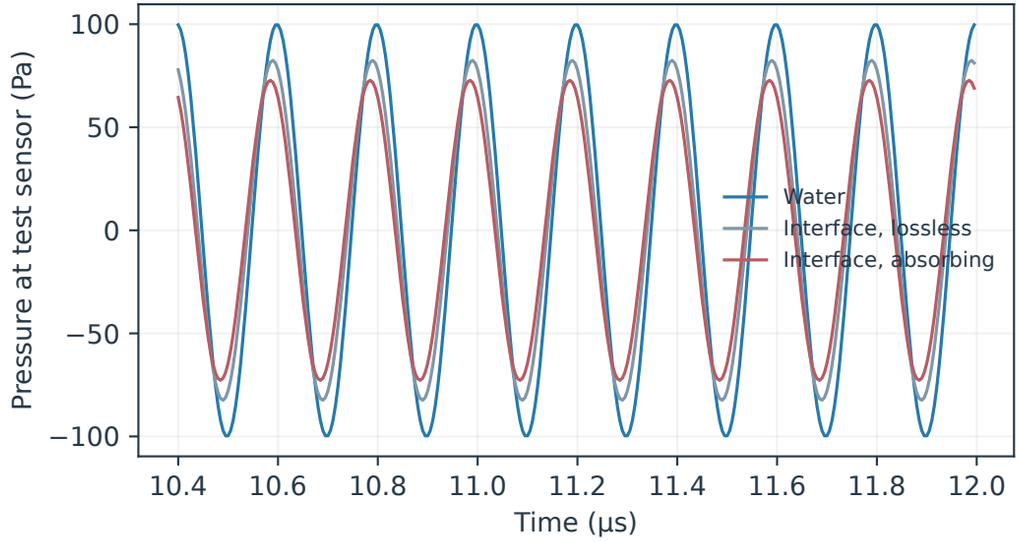
b Admission and model scope

Three apparatus bases: NOT_RUN

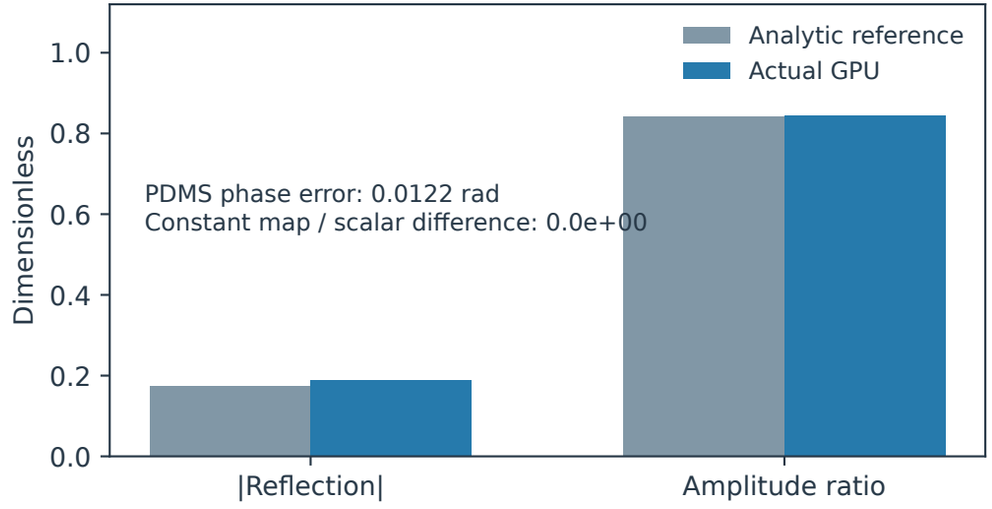
- Memory / time estimates exceed budget
- End-solid acoustics uncalibrated
- No 3 MHz APECSS response

Actual GPU adapter tests: 5 MHz
Longitudinal equivalent fluid; no shear
Source pressure ≠ voltage calibration

c Actual 3D planar validation output



d Numerical interface / loss checks



The 32.5 mm apparatus field was not computed. Panels c–d are bounded numerical tests, not apparatus pressure predictions.
PDMS: literature reference, 3–7 MHz coverage. Top-port placement reference, actual media and source calibration remain unresolved.
