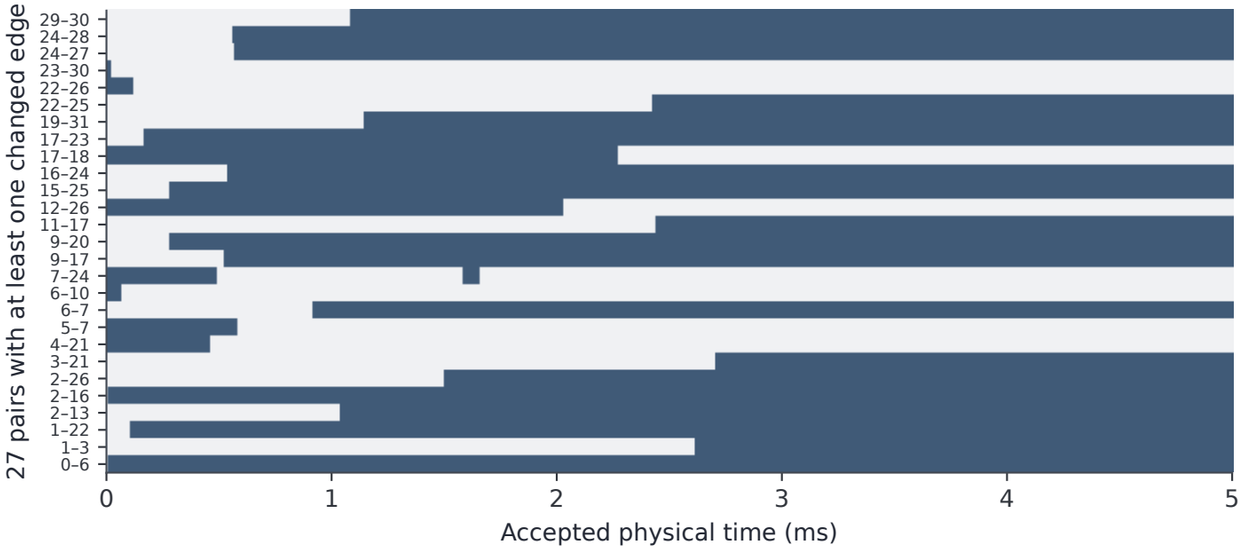
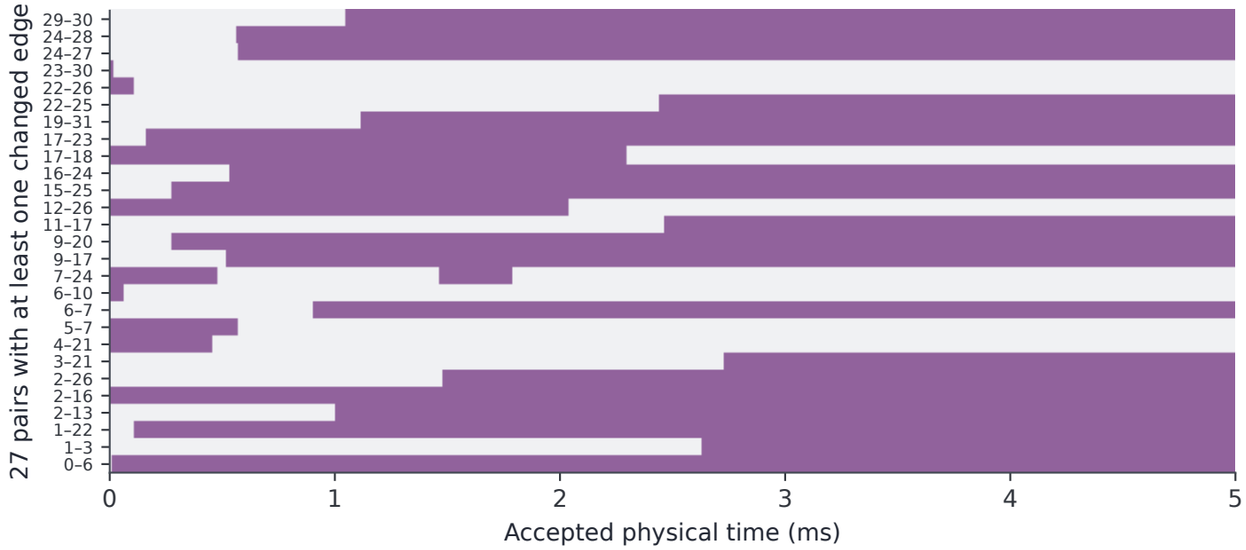
Instantaneous edges and persistent group topology are separate labels

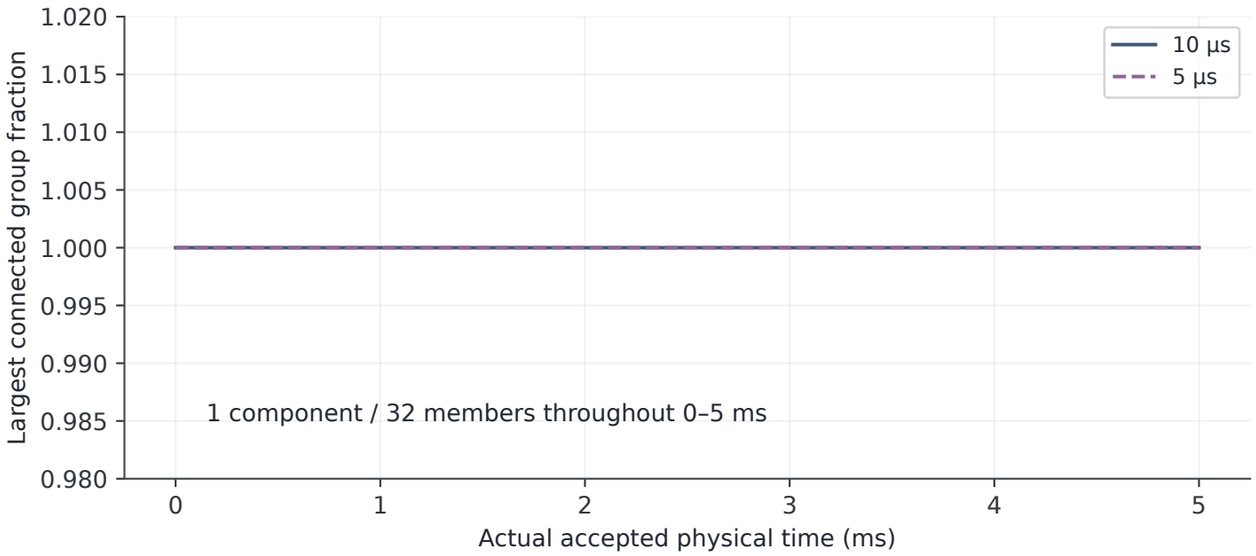
a 10 µs: colored = connected



b 5 µs: colored = connected



c Identical members: all IDs 0–31, all frames



d Layered evaluation (original gates retained)

Edge identities and per-pair switch sequences: PASS

Edge timing: FAIL (12/29); cross-pair order: FAIL

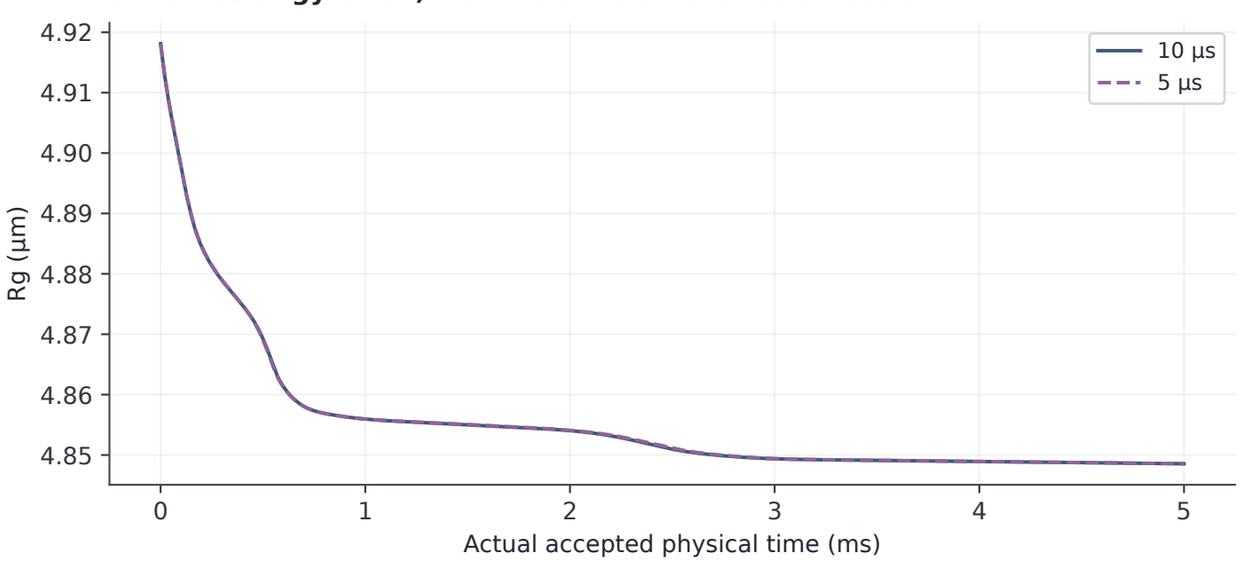
Group position and shape: PASS in this window

2 ms persistence: no split or merge observed

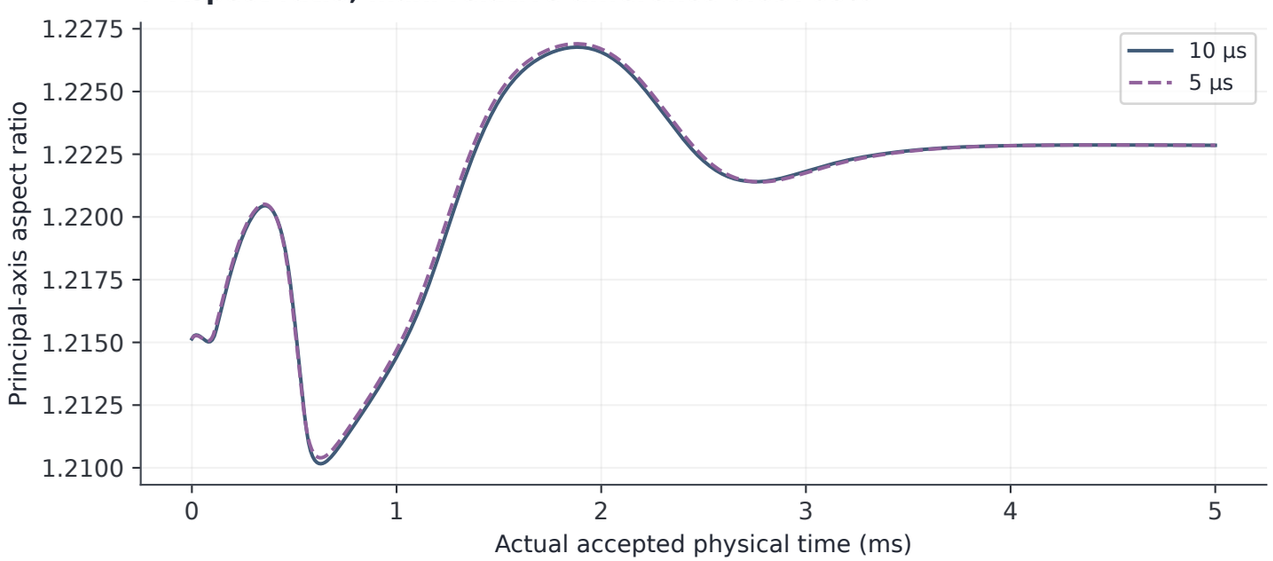
Right-censored topology events: 0

Unseen persistent-event accuracy: NOT EVALUATED

e Radius of gyration; max. relative difference 0.00636%



f Aspect ratio; max. relative difference 0.03765%



Raster shows the last accepted graph state on each interval; all final accepted states are included in group statistics and saved member lists.
No multi-component event was observed. Stable membership here does not validate unobserved fragmentation, physical fusion or AI training readiness.
