Material length scales: independent evidence, frozen baseline, and sampling limits

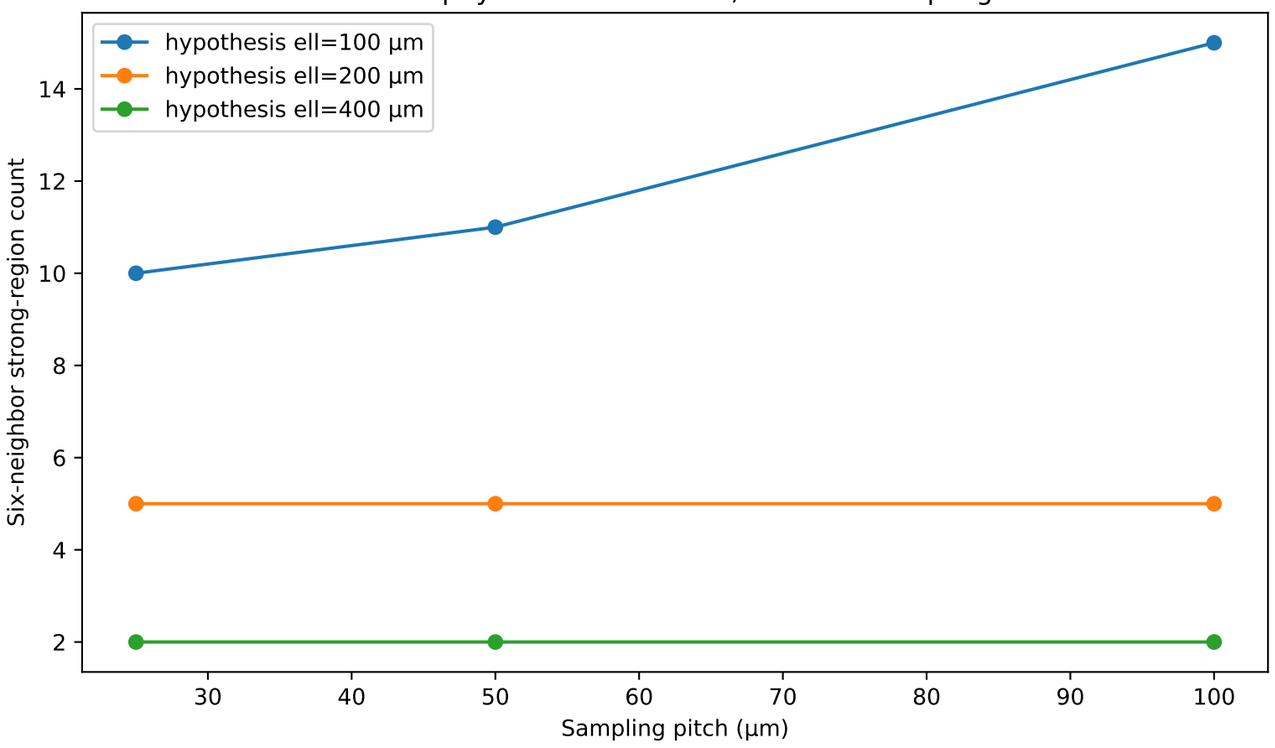

Formal baseline retained: 10 frozen regions

Region size is not fragment size

Same physical random field, different sampling

Independent evidence and resolution

- RBC: 4–7 μm; unresolved at dx=50 μm
- RBC aggregates: broadly hundreds of μm
- Porous boundaries: broadly tens of μm
- Fracture process / nonlinear zone: 0.1–1 mm

These describe different physical objects.
No measured phase covariance is available for this clot.

Formal material unchanged.

Candidates: OFFLINE HYPOTHESES ONLY.
