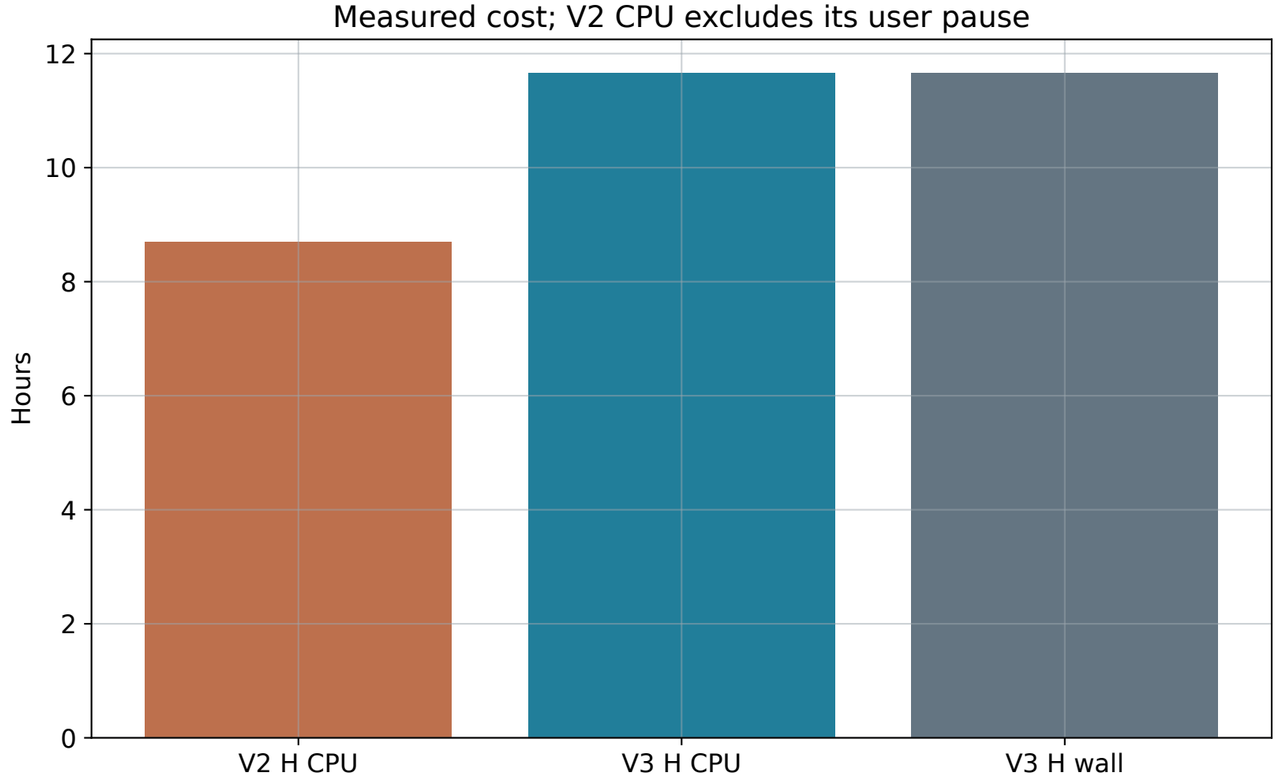
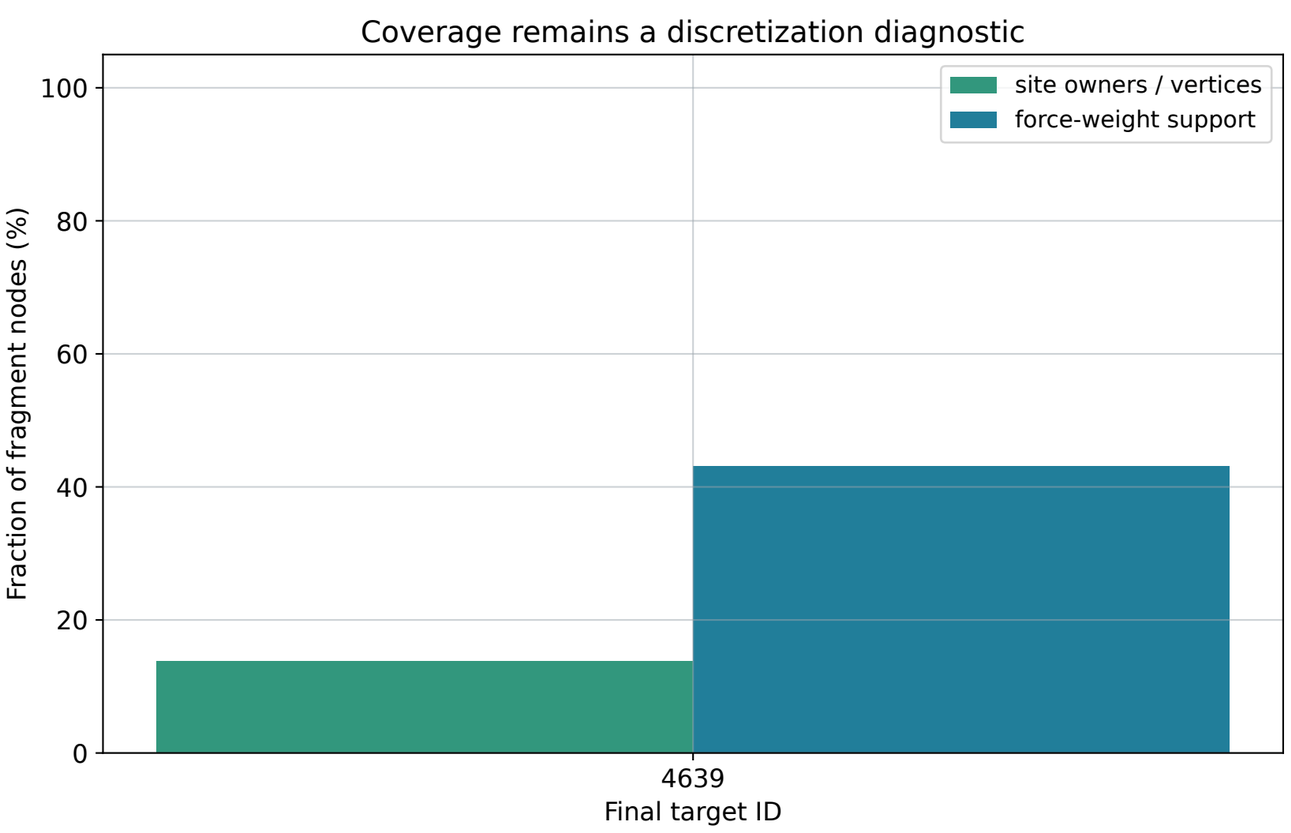
FIG 08 | Outcomes, computational cost, and remaining model limits

Actual final outcomes

Measure	V2 H	V3 H
20–200-node targets	3	1
largest free component	934	900
target / initial mass	2.683%	0.714%
1–2 fines / detached mass	35.76%	41.14%
detached / initial mass	90.63%	90.62%





Interpretation limits

- Same H material and prescribed load; surface method changed.
- Partial control-volume surface, bounded affine extrapolation.
- Fines and uncertain geometry: FLUID_LOADING_UNRESOLVED.
- Mechanical shear proxy; no validated bubble-flow coupling.
- Material and correlation length remain uncalibrated.
- Temporal association does not prove drag caused a split.
- New H versus old Uniform is not a material-only control.
