3. Compare with the Original Authors' Code

Existing L075 comparison | Peridynamics.jl / RKCMaterial | Commit b6e86563845a

(a) Same specimen, same inputs

2,197 particles | Strain 0.3% | Horizon 251.25 µm

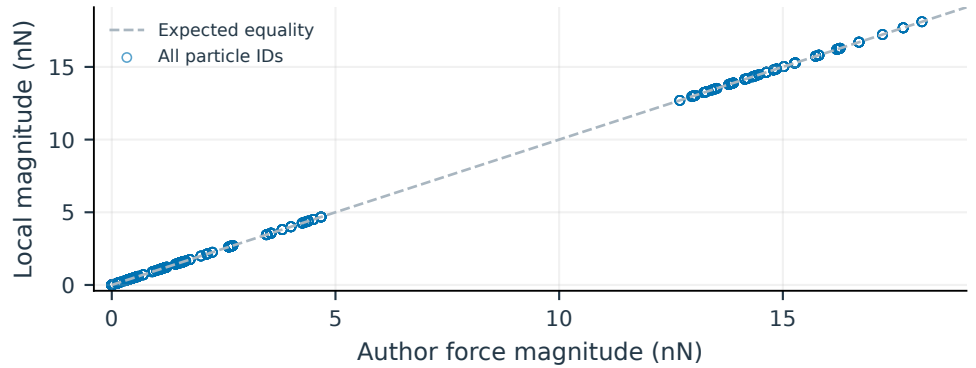

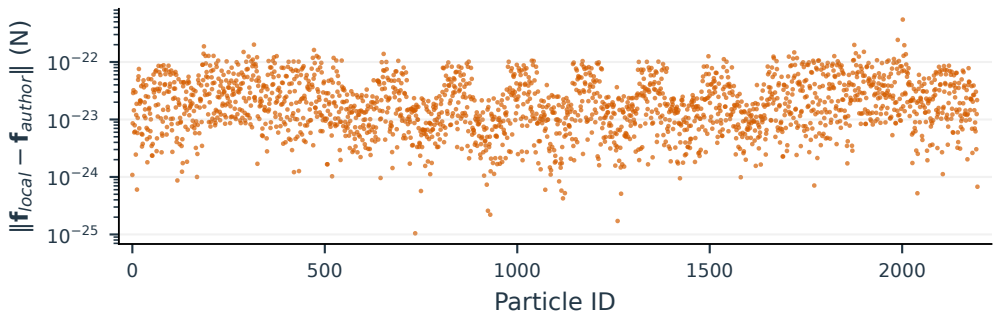

Local code
Python / BAQP

Original author code
Julia / RKCMaterial

Identical coordinates, volumes, horizon and material.

(b) Compare every particle's force

Vector force relative difference: 5.86e-15

All 2,197 particles; maximum absolute difference 5.47e-22 N

Particle IDs are aligned before comparing all three force components. Coincident points overlap; none are subsampled.

Agreement checks the implementation; it does not resolve the physical boundary-loading question. Phase and time integration were disabled.
