Loading at the current position

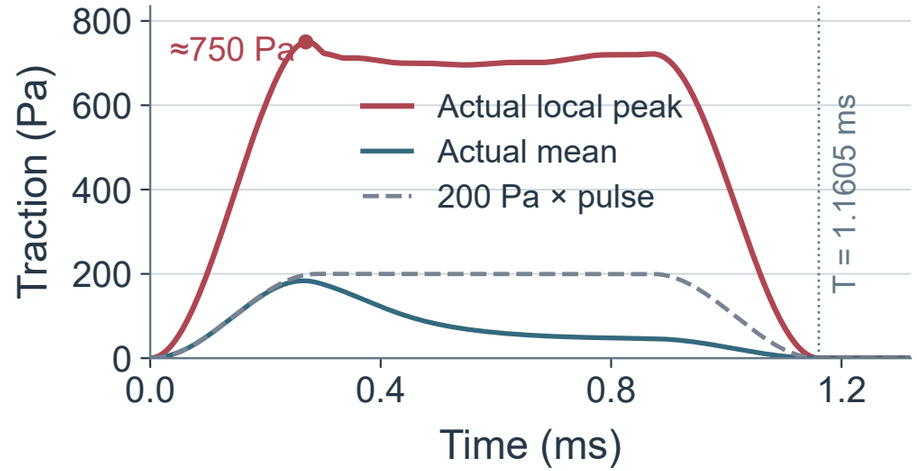

(a) Nodal load · t = 0.270 ms

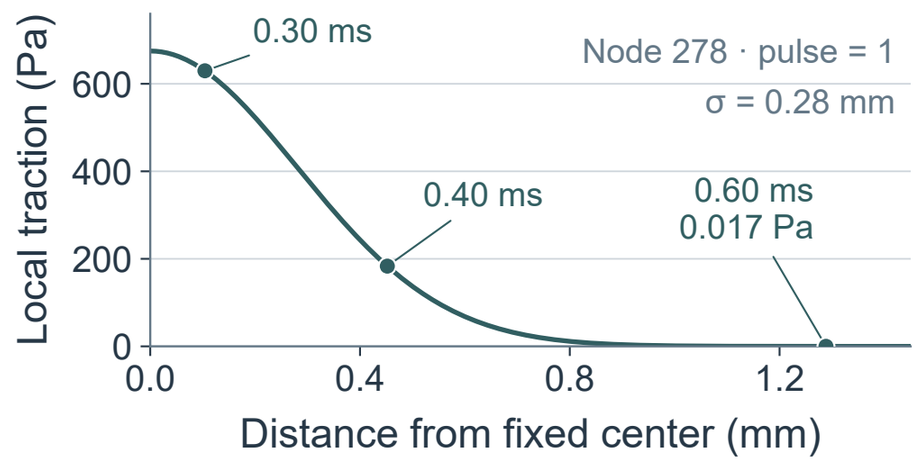

$$\mathbf{F}_i^{\text{load}} = A_i \, \tau(\mathbf{x}_i(t), t) \, \mathbf{t}_i^0$$

Reference area and tangent; current-position field

(b) Loading history

(c) A node leaving the loaded region

Clot nodes · Fixed anchors · Surviving bonds · Load force

Gaussian spatial decay; no hard cutoff. Arrows show a sparse sample of actual nodal load forces.
