Reference specimen and spatially correlated softening · exploratory, uncalibrated

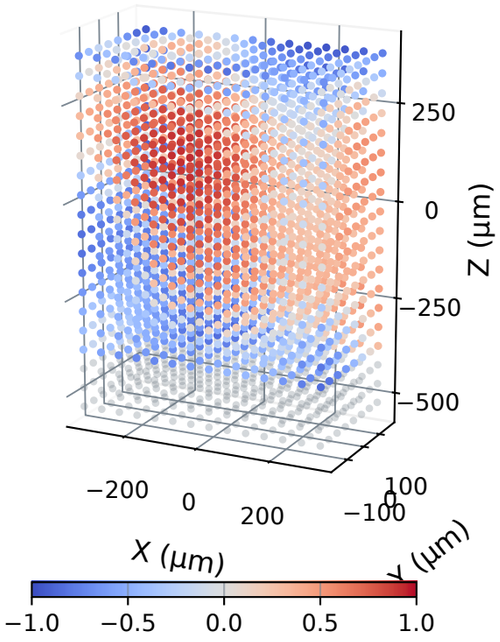

A · Original material and anchors

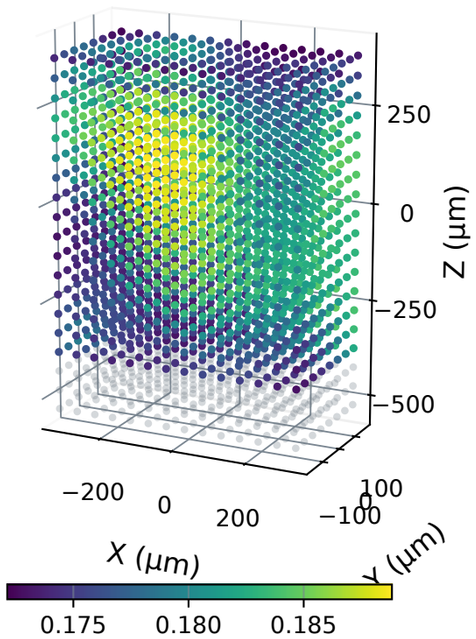

B · Uniform bulk sc = 0.18

C · Frozen reference field q

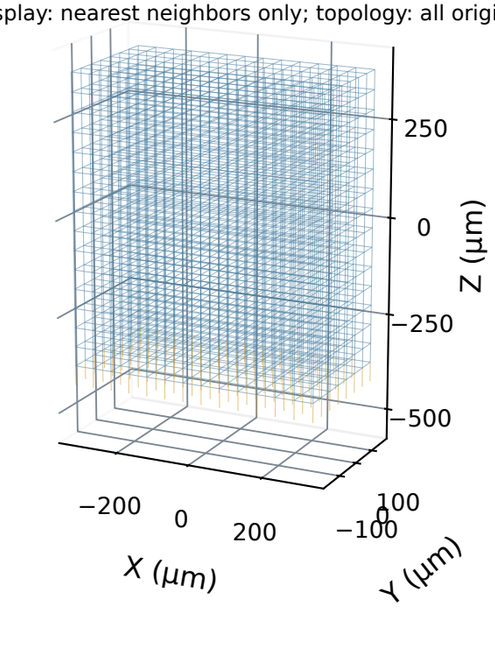

D · Node softening proxy

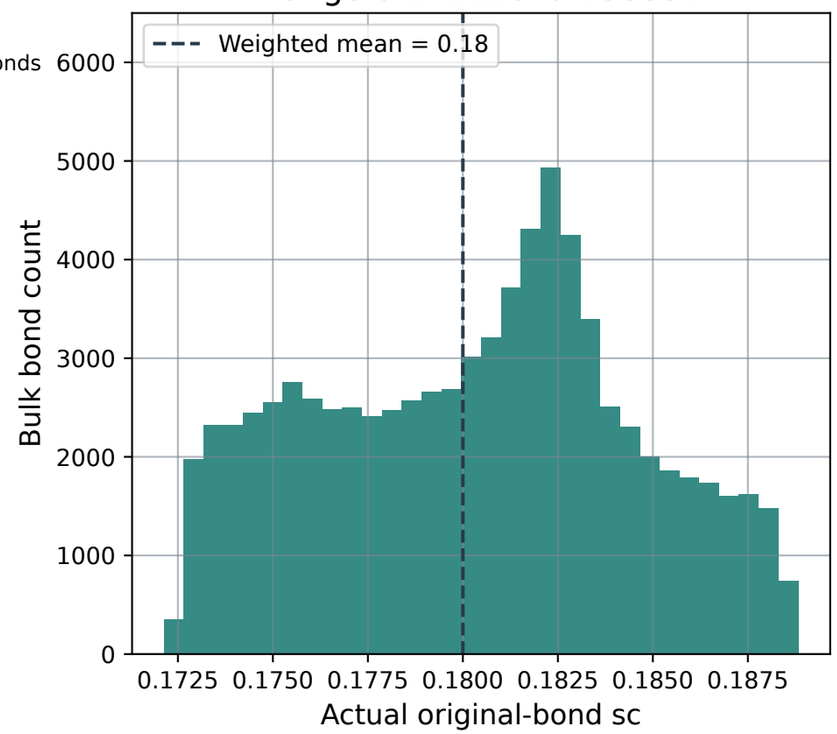

E · Original bulk / interface bonds

Display: nearest neighbors only; topology: all original bonds

F · Actual bulk-bond sc

Range 0.172129–0.188831

D is a node display proxy; mechanics uses symmetric qij and actual pair-specific sc. Original IDs, bonds, weighted volume and precut retained.
