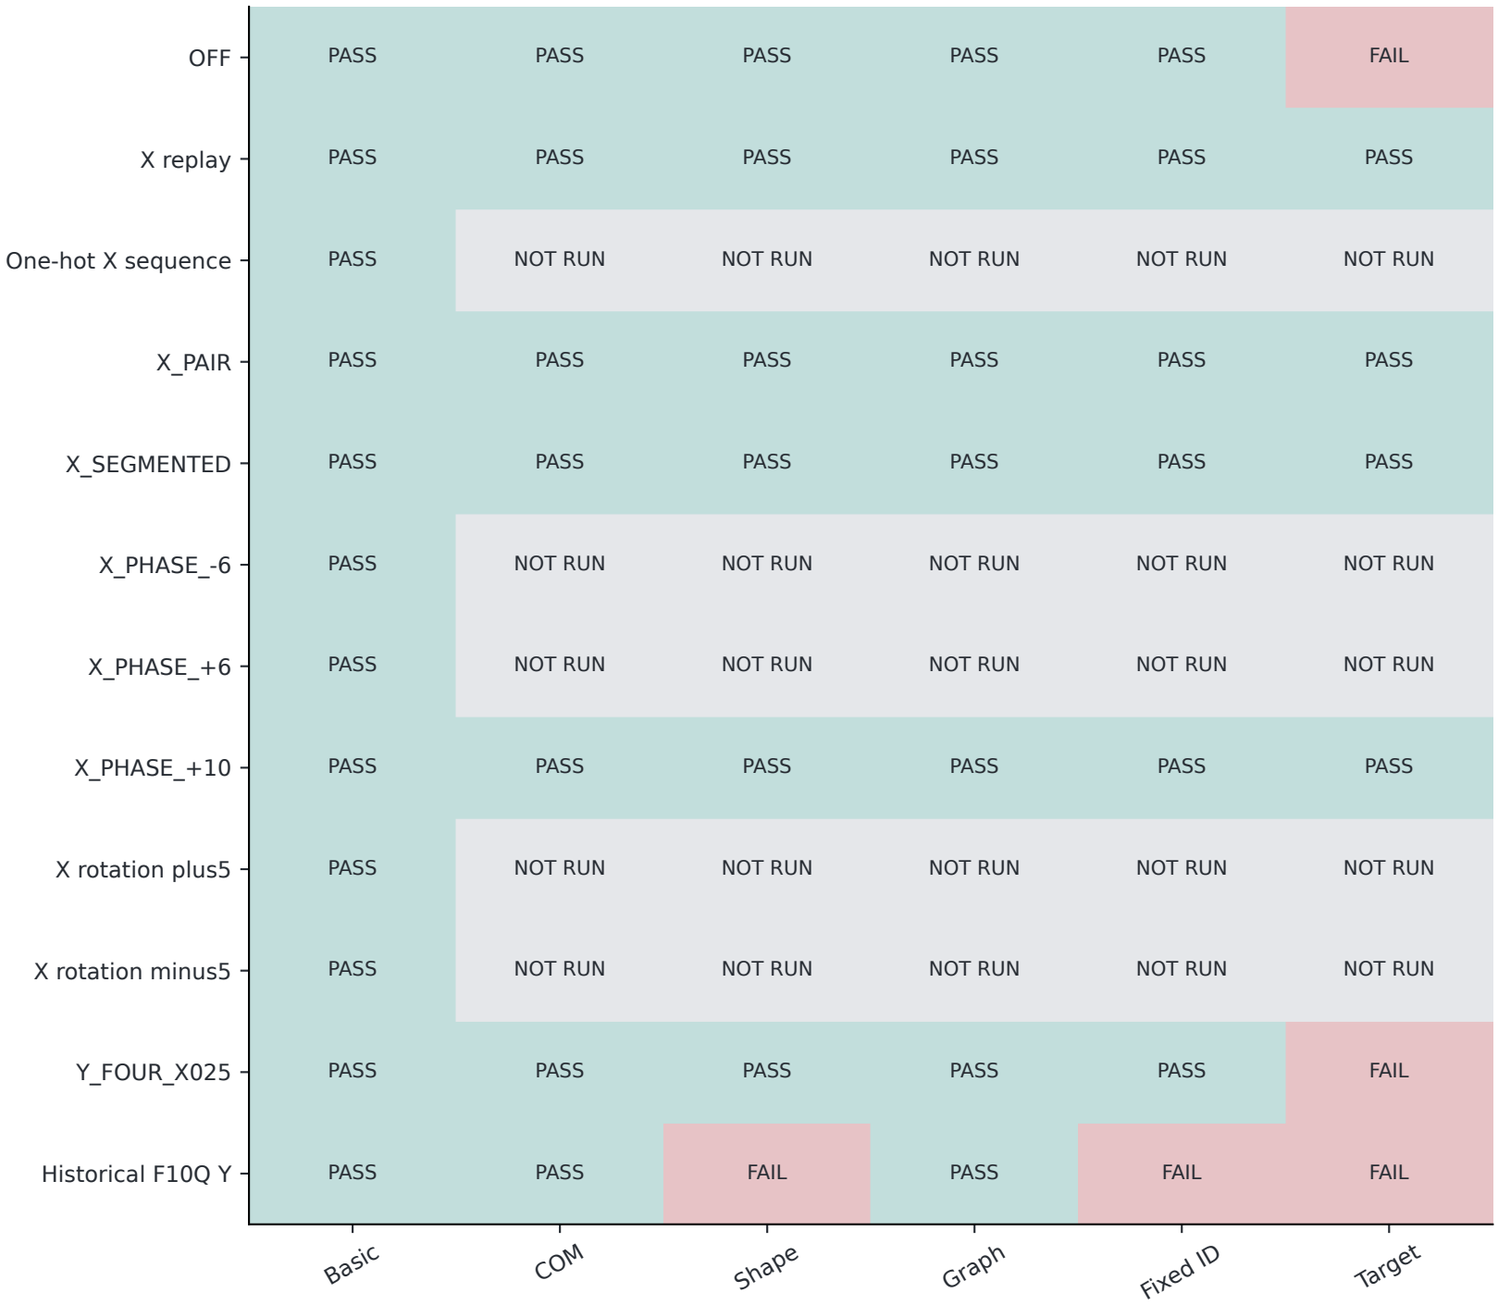
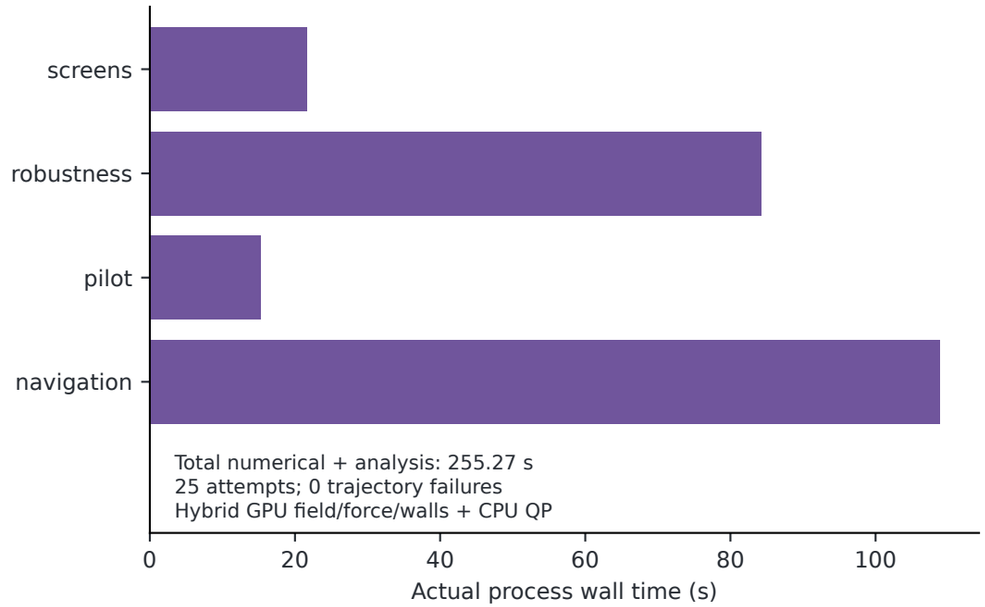
Control admission, numerical scope and computational cost

a Independent admission layers



b Finite scientific execution cost



c Scope and unmeasured quantities

Three simulation control modes: implemented

Exact F10Q X replay: PASS (0 coordinate difference)

Numerical thresholds: unchanged

Ideal scheduled events; measured hardware delay: NOT RUN

Instrument commands / real voltage output: NOT RUN

Pa-equivalent → Vpp calibration: NOT AVAILABLE

PDMS reflection and streaming: NOT SIMULATED

Long-time moving-trap navigation: NOT RUN

Experimental validation: NOT VERIFIED

AI training admission: false

NOT RUN is distinct from FAIL; short/rotated-state observations do not inherit unperformed numerical comparisons
All Y results: HOMOGENEOUS_WATER_PROXY_SPECIFIC
EXPLORATORY · HOMOGENEOUS_WATER_CONTROL_PROXY · PHYSICS_UNCALIBRATED · training_ready=false
