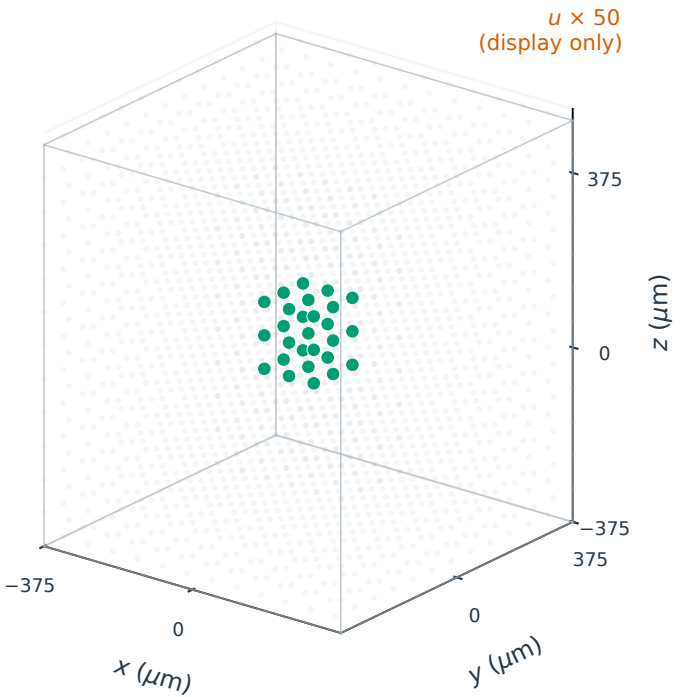
Boundary influence or a bulk operator defect?

The existing test has not isolated a boundary-independent force stencil



Green: 27 full-family particles

Gray: surrounding finite-domain particles

Geometrically full families	27
Closed two-hop cores	0
Closed three-hop cores	0
Core max |f| / R	1.068e-04
Declared noise criterion	1e-10
Core / collar maximum force	0.01999
Declared ratio criterion	1e-04

Geometric core test: FAIL

Boundary influence or bulk defect?

Physical cause: UNRESOLVED

Energy derivatives and the pinned reference implementation reproduce these forces.

Next discriminating test: close the full coefficient-dependency stencil. This test has not been run.

A possible 3δ dependence bound is not a validated boundary-layer thickness or a boundary-condition prescription.
