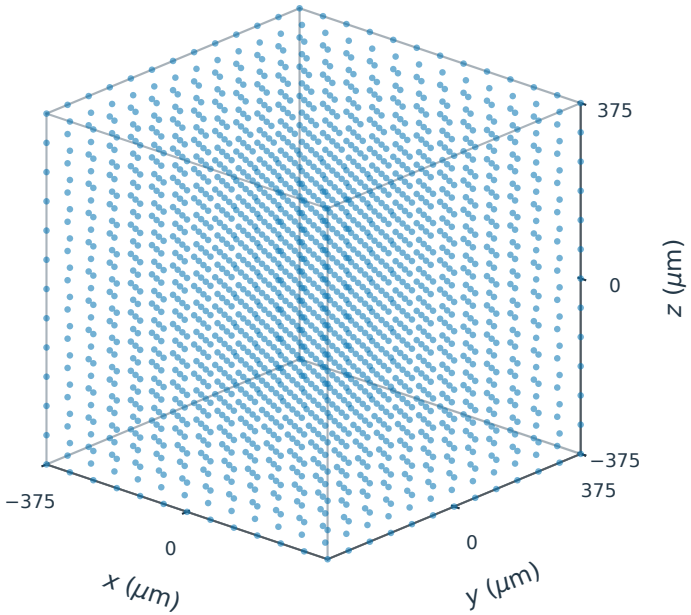
1. Check How the Model Is Built

Existing L075 numerical specimen | Spacing h = 62.5 μm | Interaction radius δ = 251.25 μm

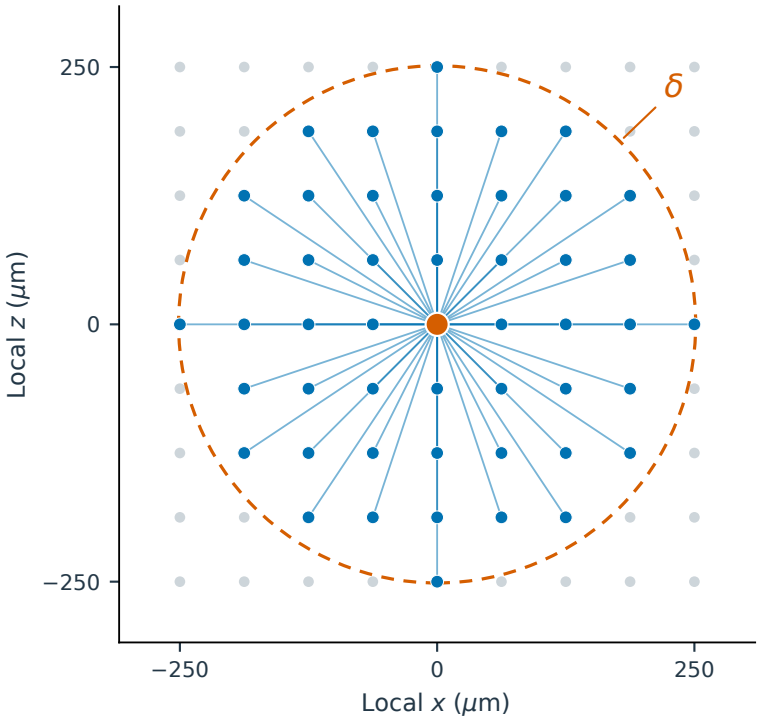
(a) Model split into particles



2,197 particles

Actual 13 × 13 × 13 discretization

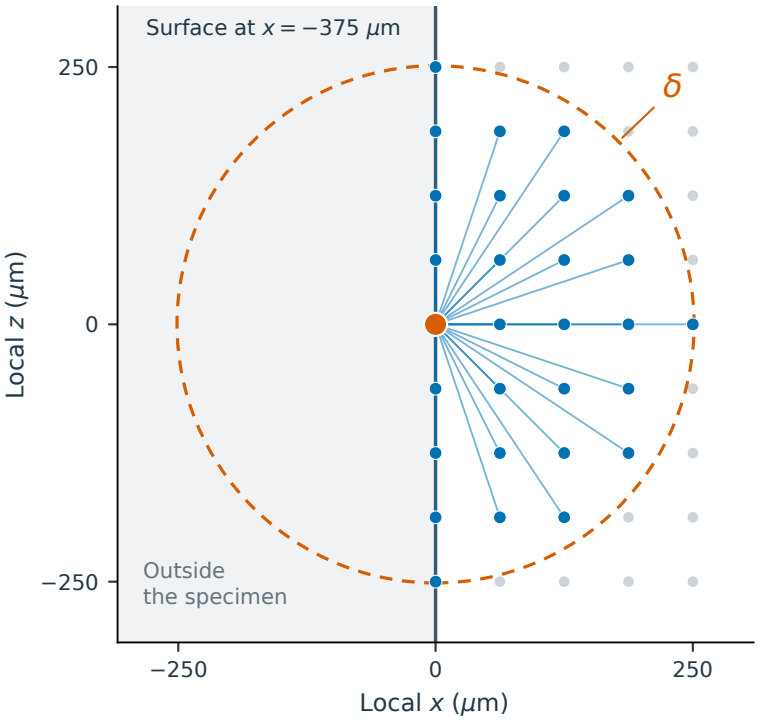
(b) Each particle linked to neighbors



Interior: 256 neighbors in 3D

48 in-plane connections shown

(c) Surface particles have fewer neighbors



Surface: 152 neighbors in 3D

28 in-plane connections shown

Blue: particles and connections Orange point: selected particle Dashed circle: interaction radius

Connection panels show the actual y = 0 slice; counts refer to all 3D neighbors. This specimen is not an anatomical clot reconstruction.
